The purpose of this test is to see how you approach a problem and what your solutions look like. The requirements for this test are simple and should be straightforward to grasp. There is no need to invest more than 4-5 hours on the solution.

Instruction

Create a sandbox Java banking application that can be used for:

- Sending money between two pre-existing accounts with a positive starting balance.
- Requesting the account balance and list of transactions.

Requirements

- It exposes an HTTP JSON interface for:
  - sending money between accounts
  - requesting an account status with account balance and list of transactions
- Accounts and transactions are persisted in a relational database.

Testing

- Implement one integration test that:
  - Sends money from one account to another
  - Verifies that resulting account balances are correct

Distribution

- Send a zip file containing the complete project to backend-hiring@monese.com.
- Includes a README file containing instructions on how to run it.
